Generalized lymphadenopathy associated with hepato-splenomegaly along with systemic symptoms and abnormal complete blood count is clinically suspected of lymphoma. However, many benign conditions such as infections, autoimmune diseases, drug hypersensitivity, sarcoidosis, Gaucher's disease and other benign reactive lymphadenopathy such as Kikuchi's disease, Rosai Dorfman disease, etc. could present with the same clinical manifestations and mimicking lymphoma. It is very important to have accurate diagnosis as different treatment is required for each diagnosis. The example cases with clinical mimicking lymphoma will be presented and discussed.

Keywords: Lymphadenopathy, Lymphoma, Mimicking lymphoma
